DESCRIPTIVE ANALYTICS REPORT

NYKAA

Reading Order-Level Purchase Behaviour at Scale

Order Trends, Category Mix, Fulfilment Reliability, Regional Demand & Platform Health

NAME	Komal Agarwal
ROLL NO.	1250258243
COURSE	BCA(DS&AI)
SECTION	BCADS24

Note on data: This report is built on a synthetically generated, Nykaa-style dataset made up of 200 aggregated records spanning 5 dates (3–23 June 2026), 8 states and 6 purchase categories. Because the records are already summarised rather than drawn from raw, order-level events, the findings below describe patterns within this generated sample only and should not be read as Nykaa's actual live order data.

Table of Contents

REPORT SECTIONS

01 Objective.....3
02 How This Would Work at Real Scale.....3
03 Daily Order Volume.....3
04 Daily Trending Over Time.....4
05 Best-Performing Purchase Categories.....5
06 Purchase Categories Contributing the Most to Overall GMV.....6
07 Category Deep-Dive.....7

12 Success Rate.....11
13 Active Sellers vs Order Volume.....12
14 Weekday vs Weekend Purchase Pattern.....13
15 Customer Satisfaction (CSAT).....14

APPENDICES

- Summary of Key Metrics.....16
- Next Steps to Move from Descriptive → Predictive.....16
- Glossary.....16

1. Objective

This layer of descriptive analytics is built on top of Nykaa's order data to give a clear, repeatable answer to the recurring operational and commercial questions the business tracks:

- What direction is daily order volume moving in, and how fast?
- How is daily revenue — measured as Gross Merchandise Value — moving over time, and when do the peaks land?
- Which purchase category drives the highest order volume?
- Which purchase categories bring in the largest share of overall revenue?
- Which states generate the highest order volumes?
- Which states drive the largest share of revenue?
- What proportion of orders complete successfully?
- How does order activity and demand vary geographically, state by state?
- What is the relationship between active seller counts and order volume?
- How do weekday and weekend purchase patterns compare?
- What does Customer Satisfaction (CSAT) look like across the sampled data?

2. How This Would Work at Real Scale

Handling order-event data for a beauty and personal-care marketplace at real scale is fundamentally a data-engineering challenge before it becomes an analytics one. A production-grade pipeline would ingest order events as they happen, roll them up by time, category and state, persist both the raw and the aggregated layers, and surface the resulting KPIs through a reporting or visualization layer.

Layer	Purpose	Typical tools
Investigation	Explore, understand and prepare the order dataset	Google, Claude & ChatGPT
Stream processing	Roll up events by category, state and time	Jupyter Notebook (Python)
Storage	Persist raw and processed data	Excel files / CSV files
Batch aggregation	Compute daily KPIs and summaries	Jupyter Notebook
Reporting	Present analysis, charts and insights	Data Visualization / MS Word

3. Daily Order Volume

Across the 5-day window covered by the sample (3–23 June 2026), the dataset logs 87,02,587 orders and roughly ₹1,214.07 crore in GMV. The chart below traces how order volume moves across the dates available in the sample.

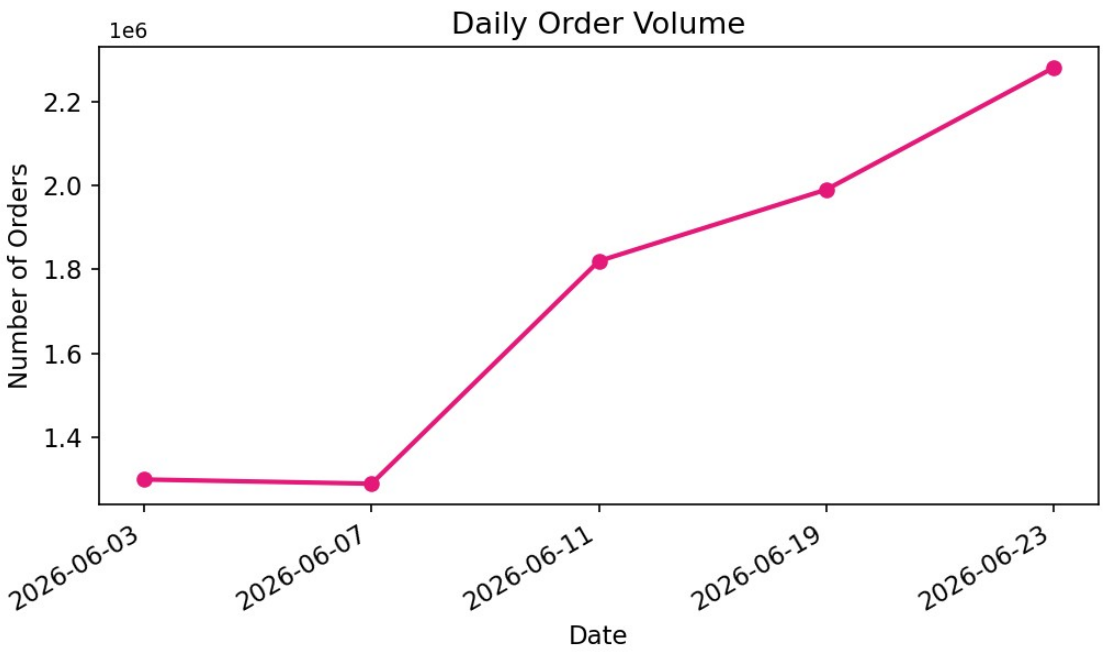

Figure 1. Daily order volume

INSIGHTS

- Dates with a higher order count point to periods of stronger buying activity.
- Dates with a lower count reflect comparatively quieter demand.
- Tracking daily order volume this way surfaces swings in demand as they happen.
- That visibility feeds directly into operational and logistics capacity planning.

KPI SNAPSHOT

Total orders: 8.70 Million

4. Daily Trending Over Time

GMV across the generated records totals ~₹12.14 Billion. On average, each represented date accounts for ~₹2.428 Billion, and the single highest daily figure reaches ~₹3.18 Billion. All GMV figures here are computed directly from the dataset's GMV field.

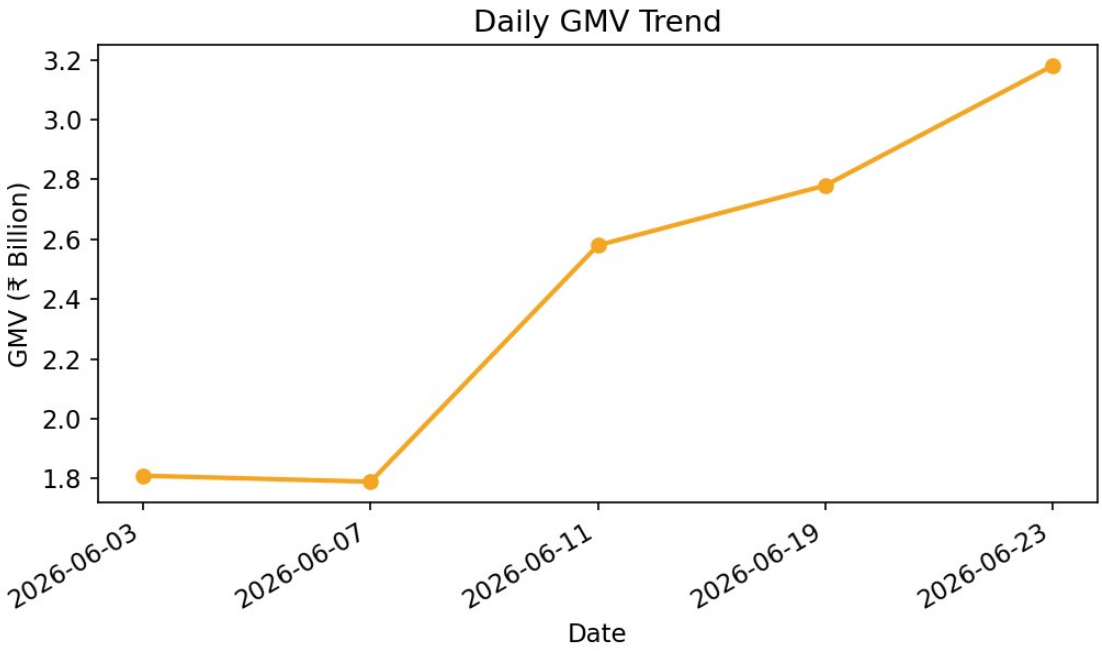

Figure 2. Daily GMV trend

INSIGHTS

- GMV fluctuates from one available date to the next.
- A higher GMV reading signals stronger monetary purchase activity that day.
- Watching GMV daily helps flag the highest-value purchase windows.
- GMV is most informative when read together with order volume, not in isolation.

KPI SNAPSHOT

Total GMV: ₹12.14 Billion
Average GMV per represented date: ≈ ₹2.428 Billion
Peak daily GMV: ≈ ₹3.18 Billion

5. Best-Performing Purchase Categories

By order volume, Skincare comes out on top across the generated dataset, making up ≈30.5% of all orders. Because the sample spans 6 categories rather than one, the chart below places Skincare's standing alongside the other five.

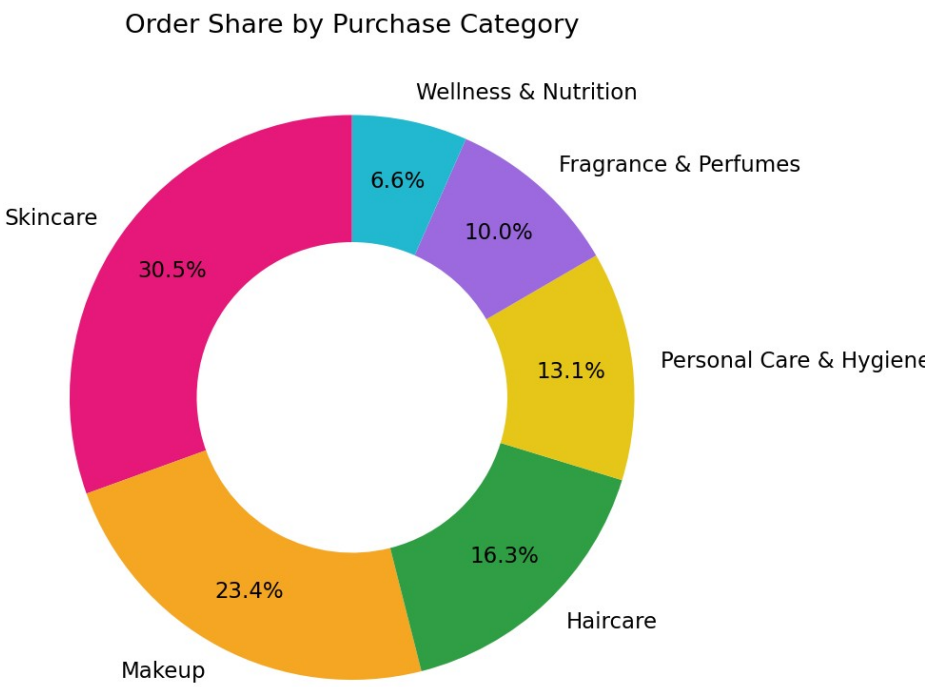

Figure 3. Order share by purchase category

INSIGHTS

- Skincare tops order volume, with Makeup and Haircare following behind it.
- Demand is not spread evenly — higher-consideration categories like skincare and makeup pull ahead of the rest.
- This pattern is specific to the generated dataset and should be read within that boundary.

KPI SNAPSHOT

Top purchase category: Skincare
Order share: ≈30.5%
Categories represented: 6

6. Purchase Categories Contributing the Most to Overall GMV

Skincare also leads on GMV, making up ≈31.7% of the dataset's total. Makeup trails closely behind at ≈29.7%, while Fragrance & Perfumes — despite a smaller share of orders — accounts for ≈17.0% of GMV, pointing to a noticeably higher average order value in that category.

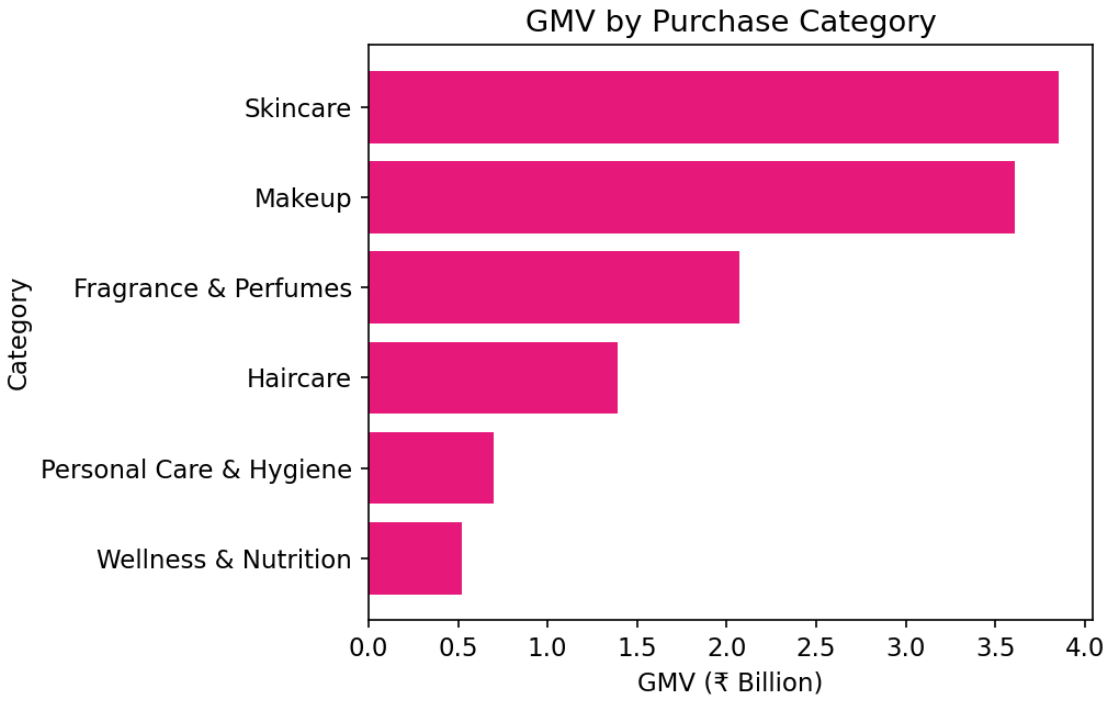

Figure 4. GMV by purchase category

INSIGHTS

- A category's share of GMV doesn't always track its share of orders, since average order values differ by category.
- Premium categories such as fragrance & perfumes can punch above their order-volume weight in GMV terms.
- As with the other findings here, this pattern holds only within the generated dataset.

KPI SNAPSHOT

Top GMV category: Skincare
GMV share: ≈31.7%
Categories represented: 6

7. Category Deep-Dive

The table below brings order volume, average order value, success rate and CSAT together for each purchase category, giving a single reference view of how each one performs.

Category	Orders	GMV (₹ Cr)	Avg Order Value (₹)	Success Rate	CSAT
Skincare	26,54,430	385.24	1,451	97.19%	4.55/5
Makeup	20,36,653	360.60	1,771	97.12%	4.54/5
Haircare	14,19,377	139.35	982	97.14%	4.56/5
Personal Care & Hygiene	11,42,079	69.66	610	97.05%	4.54/5

Category	Orders	GMV (₹ Cr)	Avg Order Value (₹)	Success Rate	CSAT
Fragrance & Perfumes	8,72,708	206.91	2,371	97.06%	4.54/5
Wellness & Nutrition	5,77,340	52.31	906	97.11%	4.57/5

INSIGHTS

- Fragrance & Perfumes carries the highest average order value (₹2,371) of the six categories, well ahead of Skincare and Makeup — consistent with it being a premium, less-frequent purchase.
- Personal Care & Hygiene sits at the other end, with the lowest average order value, in line with typical low-ticket, high-frequency buying.
- Success rate and CSAT stay in a tight band across categories (roughly 97.0–97.2% and 4.54–4.57), suggesting operational reliability doesn't swing much by category in this sample.
- This view is a useful starting point for deciding which categories merit deeper investment in catalog quality, logistics, or seller onboarding.

8. States Generating the Highest Order Volumes

Maharashtra leads every other state on order volume, with 23,89,268 orders — 27.45% of all sampled orders. It also leads on GMV, at ≈₹3.437 Billion. Taken together, this points to demand that clusters in a handful of states rather than spreading out evenly.

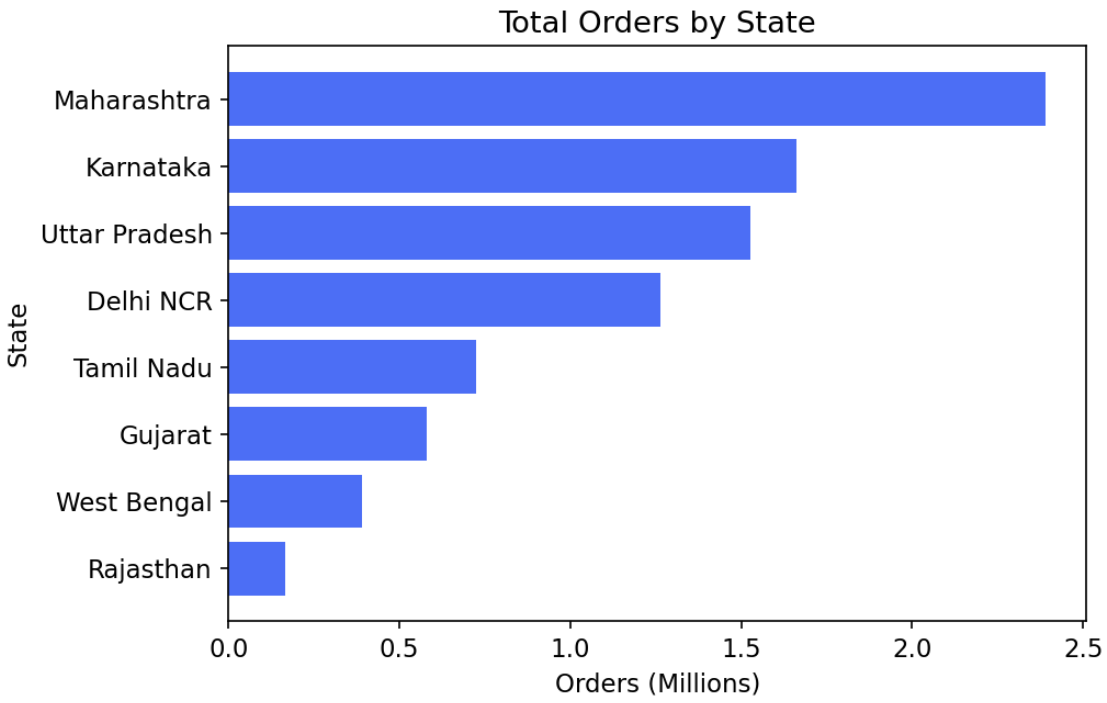

Figure 5. Total orders by state

INSIGHTS

- Order demand clusters in a small subset of states.

- That demand is far from evenly spread across the country.
- States with heavier volumes are likely to need more fulfilment and logistics support.
- State-level order analysis is a useful input into regional business planning.

KPI SNAPSHOT

Top-performing state: Maharashtra
Recorded orders: 2.39 Million
Share of total orders: ≈27.45%

9. States Contributing the Most GMV

Maharashtra is likewise the single largest contributor to GMV, at ≈₹3.437 Billion. As with order volume, GMV concentrates in a subset of states rather than being spread evenly across all eight.

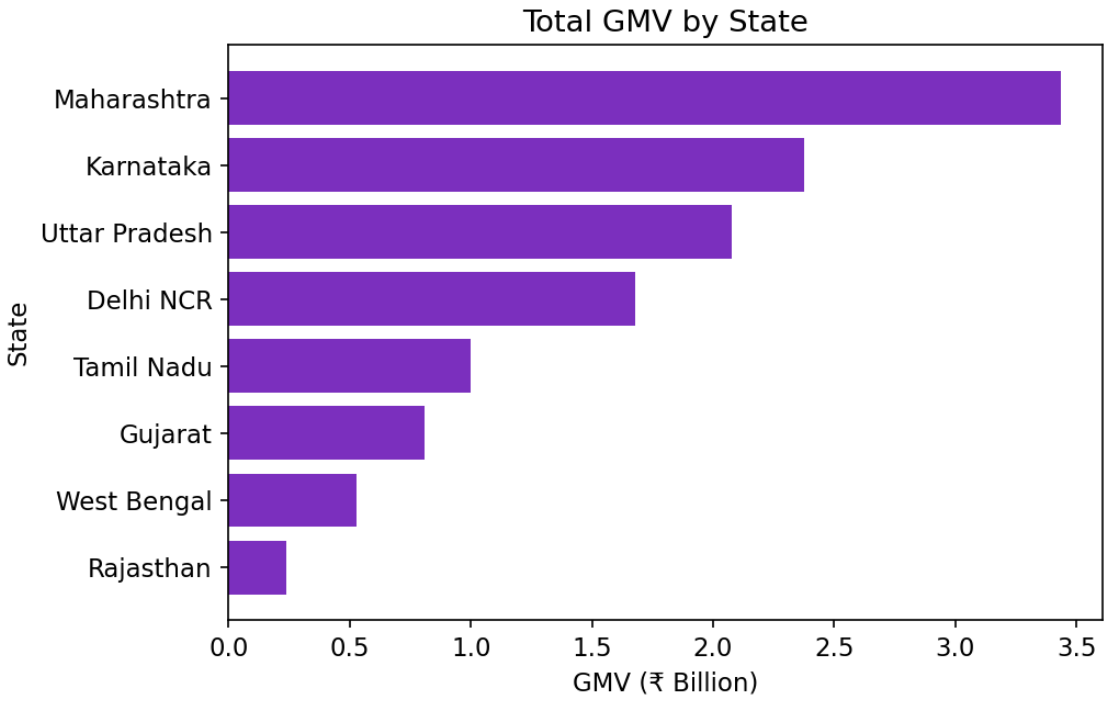

Figure 6. Total GMV by state

INSIGHTS

- The leading state shows notably strong monetary purchase activity.
- GMV, like order volume, is concentrated rather than evenly distributed.
- States that generate outsized GMV are natural priorities for operational and service planning.
- State-level GMV analysis helps flag which regions matter most commercially.

KPI SNAPSHOT

Top-performing state: Maharashtra
Recorded GMV: ≈₹3.437 Billion

10. State-wise Performance Summary

This table pulls together order volume, GMV, success rate, CSAT and seller-productivity figures for all eight states, giving one consolidated view for comparing regions.

State	Orders	GMV (₹ Cr)	Success Rate	CSAT	Active Sellers	Orders/Seller
Maharashtra	23,89,268	343.68	96.98%	4.54/5	1,35,769	17.60
Karnataka	16,62,849	237.43	97.18%	4.56/5	90,583	18.36
Uttar Pradesh	15,26,265	207.72	97.02%	4.57/5	84,079	18.15
Delhi NCR	12,63,799	167.80	97.07%	4.55/5	69,898	18.08
Tamil Nadu	7,24,342	99.89	97.08%	4.54/5	39,058	18.55
Gujarat	5,79,566	80.86	97.21%	4.54/5	34,903	16.61
West Bengal	3,90,771	53.01	97.19%	4.57/5	21,889	17.85
Rajasthan	1,65,727	23.69	97.14%	4.51/5	8,885	18.65

INSIGHTS

- Maharashtra leads on both orders and GMV, yet Rajasthan posts the highest orders-per-seller figure (18.65) — a sign of strong seller productivity relative to its smaller market.
- Gujarat has the lowest orders-per-seller ratio of the eight states, which could point to room to lift seller productivity or catalog depth.
- Success rate and CSAT hold within a narrow band across states, suggesting operational quality doesn't vary much with market size.
- This table is a practical starting point for prioritizing seller acquisition and logistics investment by state.

11. Regional Demand

Purchase demand spans 8 states in the sample. Maharashtra sits at the top with 23,89,268 orders — the highest order volume recorded. Looking at demand this way supports seller-coverage planning, operational planning, service monitoring, and state-level decision-making.

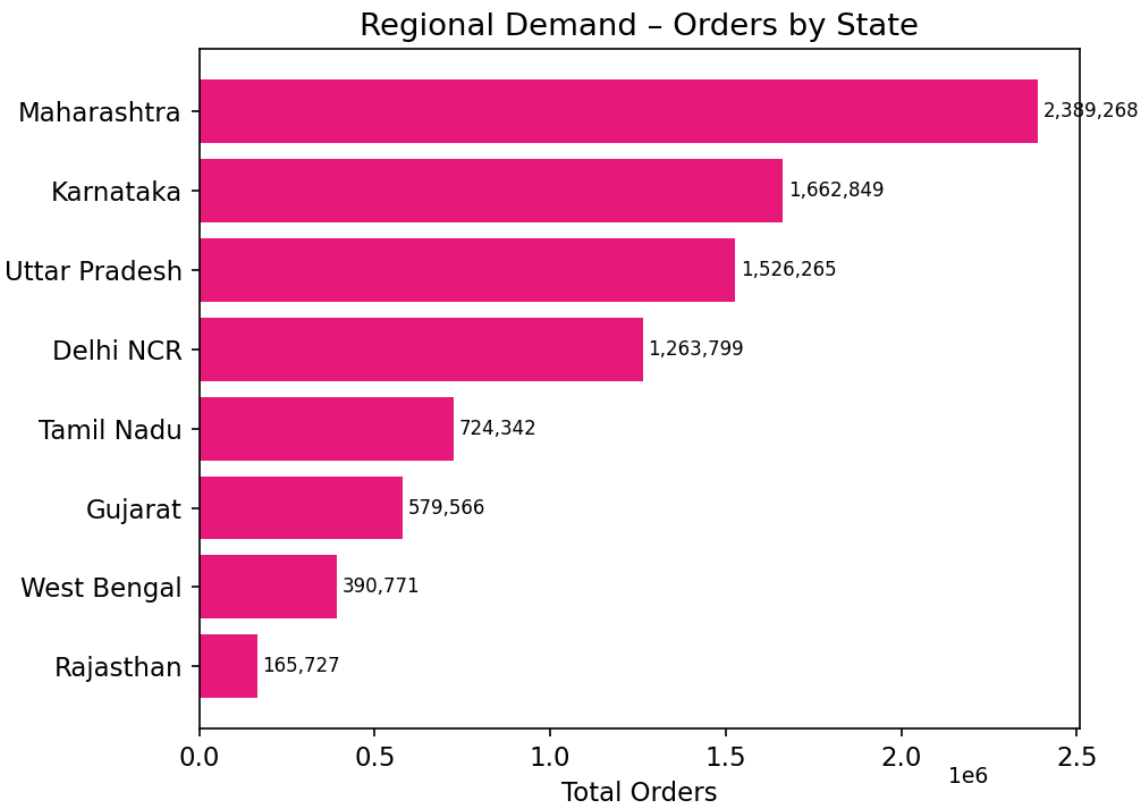

Figure 7. Regional demand – orders by state

INSIGHTS

- Regional demand data feeds directly into seller-coverage planning.
- It also supports operational planning and ongoing service monitoring.
- State-level demand figures inform regional business decisions.

KPI SNAPSHOT

Top-performing state: Maharashtra
Order volume: 2.39 Million
States covered: 8

12. Success Rate

Across the sampled records, orders complete successfully 97.11% of the time on average.

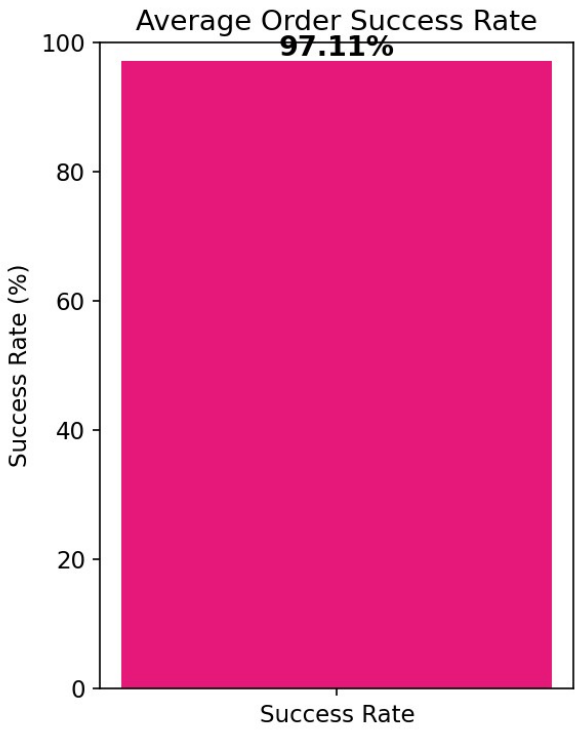

Figure 8. Average order success rate

INSIGHTS

- A state-wise breakdown could reveal which states sit above or below the overall success rate, flagging any that warrant closer investigation.
- Success rate is worth tracking continuously, since shifts in it can signal operational or payment-gateway issues.
- The average CSAT score sits at 4.55/5. Where success rate captures operational reliability, CSAT captures the customer's actual experience.

KPI SNAPSHOT

Average order success rate: 97.11%

Operational status: High order reliability

13. Active Sellers vs Order Volume

Looking at active sellers alongside order volume adds another descriptive layer to state-level activity. States with more active sellers do tend to log higher order volumes, but the scatter plot below should be read as an association, not proof that one causes the other.

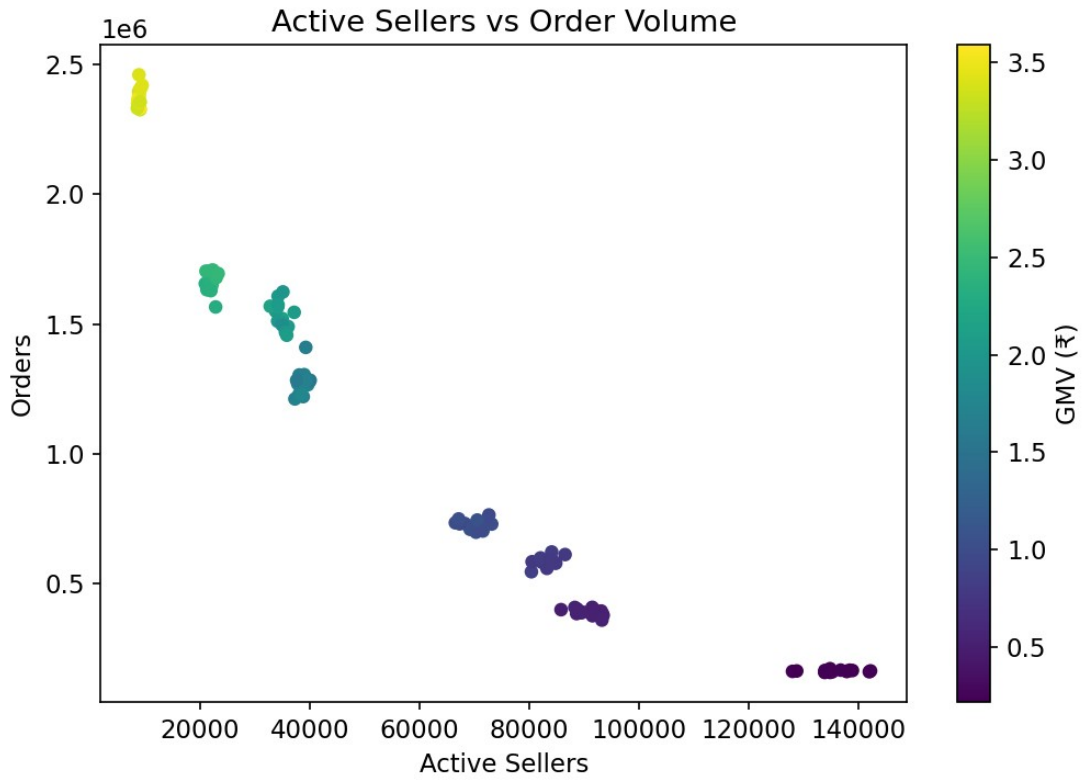

Figure 9. Active sellers vs order volume

INSIGHTS

- The positive association hints that stronger seller coverage may go hand in hand with higher order activity.
- That said, the chart doesn't establish that more sellers cause higher order volume.
- Other factors — regional demand, logistics reach, category mix — likely play a role too.
- This kind of analysis feeds into seller productivity and coverage planning.

KPI SNAPSHOT

Top order-volume state: Maharashtra
Active sellers in that state: ≈1.36 Lakh

14. Weekday vs Weekend Purchase Pattern

Looking at the row-level observations, average orders come in at 37,082 on weekdays against 53,159 on weekends.

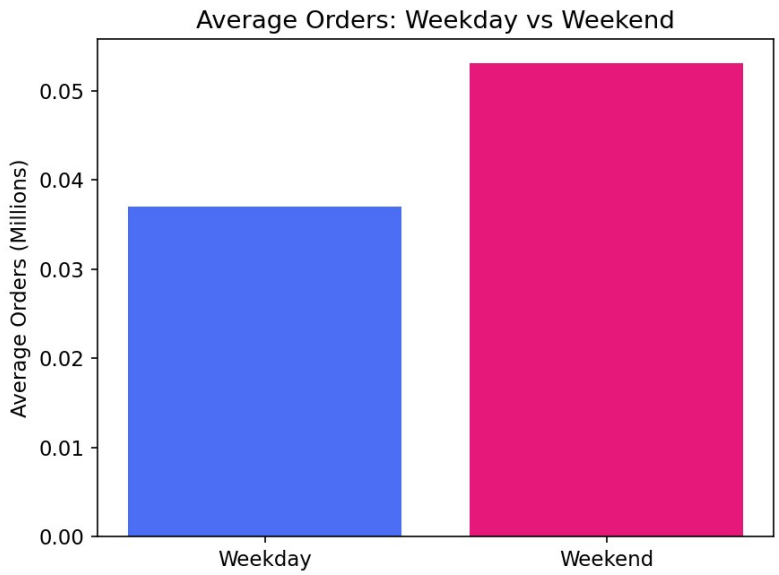

Figure 10. Weekday vs weekend average orders

INSIGHTS

- Weekend order volumes run higher on average than weekday volumes in this sample, which fits typical leisure-driven browsing and buying in beauty and personal care.
- The dataset doesn't form a complete, continuous daily series for every state/category pairing.
- For that reason, this should be read as a descriptive comparison of the available observations rather than a confirmed seasonal pattern.

KPI SNAPSHOT

Highest orders-per-seller state: Rajasthan
Orders per seller: ≈18.65
Lowest orders-per-seller state: Gujarat
Orders per seller: ≈16.61

15. Customer Satisfaction (CSAT)

The row-level average CSAT across the sample is 4.55/5. Uttar Pradesh posts the highest average at 4.575, while Rajasthan sits lowest at 4.512. CSAT is a useful customer-experience KPI to read alongside operational measures like success rate.

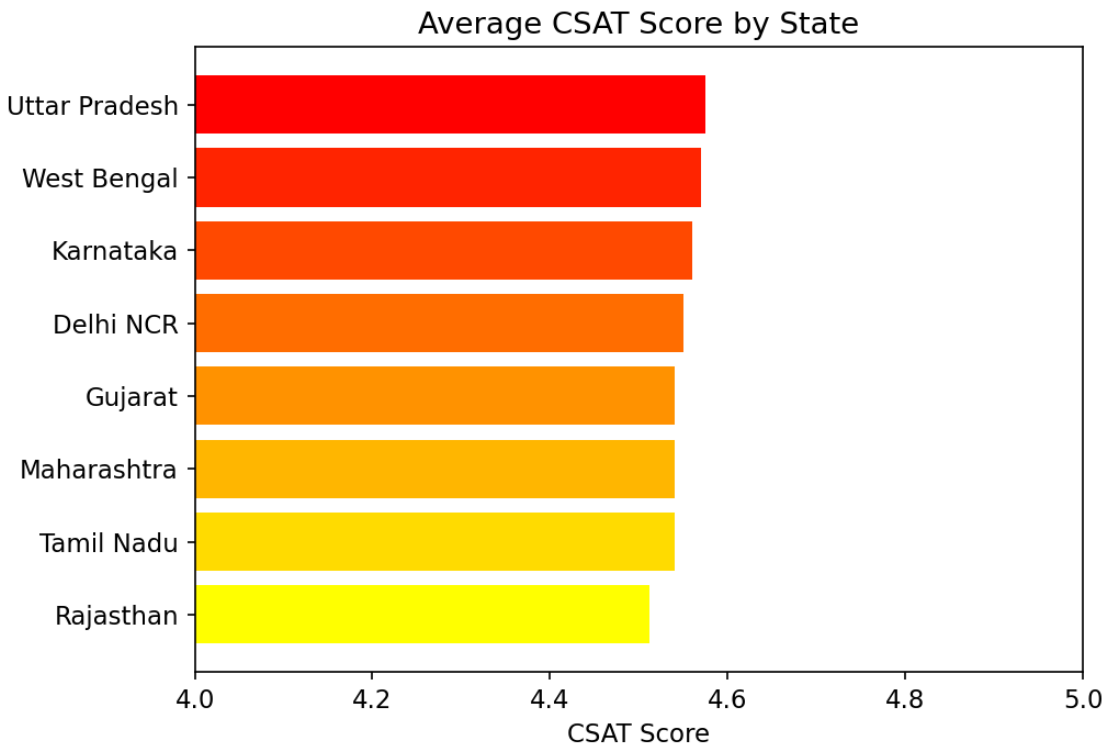

Figure 11. Average CSAT score by state

INSIGHTS

- There's some spread in customer satisfaction from one state to another.
- Uttar Pradesh posts the strongest CSAT performance among the states shown.
- Rajasthan's comparatively lower score may be worth a closer look.
- CSAT is most useful when considered together with operational KPIs such as success rate.

KPI SNAPSHOT

Highest CSAT state: Uttar Pradesh
CSAT: 4.575 / 5
Lowest CSAT state: Rajasthan
CSAT: 4.512 / 5

Summary of Key Metrics

Metric	Value
Total orders	87,02,587
Total GMV	₹1,214.07 crore
Average success rate	97.11%
Average CSAT score	4.55 / 5
States tracked	8
Purchase categories tracked	6
Dataset records	200
Downtime-flagged records	0

Next Steps to Move from Descriptive → Predictive

- Demand forecasting by state and purchase category to project future order volumes.
- Anomaly detection to catch sudden shifts in success rate, GMV, or order volume.
- Downtime-impact analysis linking operational flags to order failures and lost GMV.
- Seller productivity analysis built around orders per active seller.
- Trend and cohort analysis once a longer stretch of historical data is available.

This report describes what happened within the sampled dataset. The next analytical layer would draw on a longer time window and richer, event-level data to explain why the changes happened — and to forecast what's likely to happen next.

Glossary

- GMV — Gross Merchandise Value — the total monetary value of orders processed or sold through a platform before fees, discounts, refunds, or other adjustments are deducted. The exact definition can vary by dataset or platform.
- GST — Goods and Services Tax — India's unified indirect tax applied to the sale of goods and services, including most e-commerce transactions.
- ONDC — Open Network for Digital Commerce — an open network/protocol for digital commerce in India. Marketplaces such as Nykaa can interoperate with, or run seller listings alongside, ONDC, though ONDC itself is not a government-owned e-commerce platform.
- CSAT — Customer Satisfaction Score — a customer-experience metric typically gathered through post-purchase or post-delivery surveys asking customers to rate their satisfaction.
- Active Sellers — The count of marketplace sellers with at least one fulfilled order within the reporting window.
